Server Network Configuration

Objectives:

At the end of this episode, I will be able to:

1. Identify the appropriate network infrastructure service and server configuration, given a scenario.

Exam Objective: *2.2 - Given a scenario, configure servers to use network infrastructure services.*

Description: In this episode, the viewer will identify how to locate and configure server settings to use network infrastructure services such as DNS, IP addressing, firewall ports.

- MAC Address
  - can be important for port security
  - Most like configured inside a VLAN
- IP configuration
  - IPv4 and IPv6
  - Static vs. dynamic (DHCP) vs. APIPA
  - Utilities
    - Server Manager
    - Network and Sharing Center
    - Command line
    - Powershell
- Default Gateway
- DNS
  - Configure hostname
  - Configure DNS servers
  - Internal vs. External
- Firewall
  - Implict deny
  - Network Location (sets the firewall profile)
  - Outbound is open
  - Inbound is block
  - Think RDP and third party applications
    - Identifying ports and these services attached to those ports is important
