User and Group Management

At the end of this episode, I will be able to:

1. Identify identity and access management technologies.

Exam Objective: *3.3 - Explain important concepts pertaining to identity and access management for server administration.*

Description: In this episode, the viewer will identify techniques to govern control to resources through users and group management.

- User accounts
    - Identities that can be assigned roles, privileges and permissions on or to resources
    - Create local user accounts
        - Student01 and student02
        - Choose password (choose weak password, show in notepad)
        - Create a group called *Developers* (for later in demo)
    - Create shred folder
        - Shared folder called *Storage* with *Everyone >> Full control*
        - Assign NTFS to *Read-only* for Student01
        - Assign NTFS to *Read & execute* and *Write* for Student02
        - Create a file called *admin* (as the admin) in the *Storage* folder
        - Log out
    - Verify access control
        - Log in as Student01 and access the *Storage* folder
        - Create a file
        - Logout, log in as Student02 and access the *Storage* folder
        - Create a file
        - Delete the *admin* file
- Group accounts
    - Groups allow for easier administration of user accounts
    - Users inherit permissions through group membership
    - Assign the *Read, write and execute* permissions to the *Developers* group on the shared *Storage* folder
    - Move Student01 to the the *Developers* group

- Log out, login as Student01
- Access the *Storage* folder and create a file
