Security Issues and Tools

Objectives:

At the end of this episode, I will be able to:

1. Identify common security issues.

Exam Objective: *4.6 - Given a scenario, troubleshoot security problems.*

Description: In this episode, the viewer will identify common security issues such as unauthorized access, file integrity issues, open ports, misconfigured security software, rogue process and services, permission issues, and data loss.

- Common concerns
    - (File Hash Software - File integrity (malware, versioning/sync issues, miconfigured permissions/least privilege)
        - Implement (checksums,monitoring, detection, enforcement)
    - Improper privilege escalation (unauthorized/authorized, open ports/port sniffers)
        - User Access Controls (SELinux and UAC)
    - Excessive access (NTFS and Share permission conflict) (lack of access controls/misconfigure access controls/permissions)
    - Applications will not load (Virus/malware& anti-malware misconfiguration)
    - Cannot access network fileshares (Permissions issues, firewall rules, misconfiguration group policies mapping)
    - Unable to open files (permission misconfiguration)
    - Open ports (tools: port scanners)
    - Unencrypted communications (tools: packet sniffers)
- Demo
    - Excessive access
        - Demo permission misconfiguration
    - Identifying rogue processes/service issues
        - Demo killing process via *tasklist* and *taskkill*
    - Demo file integrity measures
        - Use hashing software to detect modifications to files
    - Demo telnet vs. SSH for unencrypted communications
